Introducing Gemini 3.5 Transcribe

Built for real-time voice-first experiences such as voice agents, real-time captioning tools, and post-call analytics pipelines.

[Try in AI Studio](#)

Hi Bruce,

Gemini 3.5 Transcribe converts raw audio directly into accurate, polished, context-aware text, performing reliably across 85+ languages, noisy acoustic environments, and domain-specific jargon.

- /// Real-time streaming ([gemini-3.5-transcribe-live](#))
Delivers continuous, bidirectional streaming with sub-second latency for interactive voice agents and real-time captioning via the [Live API](#).
- /// Pre-recorded audio processing ([gemini-3.5-transcribe](#))
Transcribes audio files up to 1 hour in a single request with multi-speaker diarization (up to 3 speakers) and word-level timestamps via the [Interactions API](#).
- /// Smart transcription mode
Filters filler words ("ums", "ahs", false starts), resolves spoken self-corrections, and automatically formats spoken lists, dates, and numbers into clean text ready for downstream LLM processing.
- /// Custom vocabulary
Accurately recognizes domain-specific terms, acronyms, and product names using a custom list of up to 1,000 terms.
- /// Global language support
Automatically detects and transcribes 85+ languages and dialects, with seamless handling of regional accents and dialects.

Start building

You can use our SDKs for Python, JavaScript, and Go, or make a direct REST API call with cURL. [Get your API key](#) and start building.

```
from google import genai

client = genai.Client()

# Upload audio file via the Files API
audio_file = client.files.upload(file="path/to/audio.wav")

# Transcribe with speaker diarization and word timestamps
interaction = client.interactions.create(
    model="gemini-3.5-transcribe",
    input=[{
        "type": "audio",
        "uri": audio_file.uri,
        "mime_type": audio_file.mime_type,
    }],
    generation_config={
        "transcription_config": {
            "language_codes": ["en-US"],
            "custom_vocabulary": ["Gemini", "Transcribe"],
            "mode": {
                "type": "verbatim",
                "diarization_mode": "speaker",
                "timestamp_granularities": ["word"],
            }
        }
    }
)

print(interaction.output_text)
```
